金奕成 杨天正 黄道吉

Automaton

- in situ排列可以通过自动机实现

$$\begin{aligned} & (\Sigma, \delta, q_0, q_f) \\ \delta : \Sigma & \rightarrow [1..n]^3 \times \Sigma^n \\ \delta(q) & = (i, j, k, q_1, \dots, q_k) \end{aligned}$$

Automaton- Σ

- 0: 对应第一行的循环
- 1: 验证它是否是cycle leader
- 2: 交换元素

1	for $j := 1$ step 1 until n do	1
2	begin comment the permutation has been	n
3	done on all cycles with leader $< j$;	n
4	$k := p(j)$;	n
5	while $k > j$ do	$n + a$
6	$k := p(k)$;	a
7	if $k = j$ then	n
8	begin comment j is a cycle leader;	b
9	$y := x[j]$; $l := p(k)$;	b
10	while $l \neq j$ do	$b + c$
11	begin $x[k] := x[l]$; $k := l$; $l := p(k)$ end ;	c
12	$x[k] := y$;	b
13	end permutation on cycle;	b
14	end loop on j .	n

Automaton- δ

- 起始状态(0, 1), 终止状态(0, n + 1)

$$\delta(0, j) = (1, 1, j, (1, j, 1), \dots, (1, j, n));$$

$$\delta(1, j, k) = \begin{cases} (1, 1, k, (1, j, 1), \dots, (1, j, n)), & \text{if } k > j; \\ (1, 1, j, (2, j, j, 1), \dots, (2, j, j, n)) & \text{if } k = j; \\ (1, 1, 1, (0, j + 1), \dots, (0, j + 1)) & \text{if } k < j; \end{cases}$$

$$\delta(2, j, k, l) = \begin{cases} (k, l, l, (2, j, l, 1), \dots, (2, j, l, n)), & \text{if } k \neq l; \\ (1, 1, 1, (0, j + 1), \dots, (0, j + 1)), & \text{if } k = l; \end{cases}$$

ALGORITHM65 :FIND

- 类似快排的算法, 只对一部分排序

```
begin           integer I,J;  
                if M < N then begin partition (A, M, N, I, J);  
                    if K  $\leq$  I then find (A,M,I,K)  
                    else if J  $\leq$  K then find (A,J,N,K)  
                    end  
end           find
```

- ALGORITHM63: PARTITION

比较次数

- 类似快排的分析, 得到

$$C_{1,1} = 0;$$

$$C_{n,t} = n - 1 + \frac{1}{n}(A_{n,t} + B_{n,t}), \quad \text{for } 1 \leq t \leq n \text{ and } n \geq 2,$$

- 其中呢

$$A_{n,t} = C_{n-1,t-1} + C_{n-2,t-2} + \cdots + C_{n-t+1,1},$$

$$B_{n,t} = C_{t,t} + C_{t+1,t} + \cdots + C_{n-1,t}.$$

分别是要找的元素在枢轴量的右边和左边的情况.

解递推方程

由定义得到
这三个式子

$$A_{n+1,t+1} - A_{n,t} = C_{n,t}$$

$$B_{n+1,t} - B_{n,t} = C_{n,t}$$

$$A_{n,t} + B_{n,t} = nC_{n,t} - n(n-1)$$

$$A_{n+1,t+1} + B_{n+1,t+1} = (n+1)C_{n+1,t+1} - n(n+1)$$

$$A_{n,t+1} + B_{n,t+1} = nC_{n,t+1} - n(n-1)$$

$$B_{n+1,t+1} - B_{n,t+1} = C_{n,t+1}$$

$$A_{n-1,t} + B_{n-1,t} = (n-1)C_{n-1,t} - (n-2)(n-1)$$

解递推方程

由定义得到
这三个式子

$$A_{n+1,t+1} - \cancel{A_{n,t}} = C_{n,t}$$

$$B_{n+1,t} - \cancel{B_{n,t}} = C_{n,t}$$

$$\cancel{A_{n,t}} + \cancel{B_{n,t}} = nC_{n,t} - n(n-1)$$

$$A_{n+1,t+1} + B_{n+1,t+1} = (n+1)C_{n+1,t+1} - n(n+1)$$

$$A_{n,t+1} + B_{n,t+1} = nC_{n,t+1} - n(n-1)$$

$$B_{n+1,t+1} - B_{n,t+1} = C_{n,t+1}$$

$$A_{n-1,t} + B_{n-1,t} = (n-1)C_{n-1,t} - (n-2)(n-1)$$

解递推方程

由定义得到
这三个式子

$$\cancel{A_{n+1,t+1}} - \cancel{A_{n,t}} = C_{n,t}$$

$$\cancel{B_{n+1,t}} - \cancel{B_{n,t}} = C_{n,t}$$

$$\cancel{A_{n,t}} + \cancel{B_{n,t}} = nC_{n,t} - n(n-1)$$

消去 $\cancel{A_{n+1,t+1}}$ $\leftarrow \cancel{A_{n+1,t+1}} + B_{n+1,t+1} = (n+1)C_{n+1,t+1} - n(n+1)$

$$A_{n,t+1} + B_{n,t+1} = nC_{n,t+1} - n(n-1)$$

$$B_{n+1,t+1} - B_{n,t+1} = C_{n,t+1}$$

$$A_{n-1,t} + B_{n-1,t} = (n-1)C_{n-1,t} - (n-2)(n-1)$$

解递推方程

由定义得到
这三个式子

$$\cancel{A_{n+1,t+1}} - \cancel{A_{n,t}} = C_{n,t}$$

$$\cancel{B_{n+1,t}} - \cancel{B_{n,t}} = C_{n,t}$$

$$\cancel{A_{n,t}} + \cancel{B_{n,t}} = nC_{n,t} - n(n-1)$$

消去 $\cancel{A_{n+1,t+1}}$
和 $\cancel{B_{n+1,t+1}}$

$$\cancel{A_{n+1,t+1}} + \cancel{B_{n+1,t+1}} = (n+1)C_{n+1,t+1} - n(n+1)$$

$$A_{n,t+1} + \cancel{B_{n,t+1}} = nC_{n,t+1} - n(n-1)$$

$$\cancel{B_{n+1,t+1}} - \cancel{B_{n,t+1}} = C_{n,t+1}$$

$$A_{n-1,t} + B_{n-1,t} = (n-1)C_{n-1,t} - (n-2)(n-1)$$

解递推方程

由定义得到
这三个式子

$$\cancel{A_{n+1,t+1}} - \cancel{A_{n,t}} = C_{n,t}$$

$$\cancel{B_{n+1,t}} - \cancel{B_{n,t}} = C_{n,t}$$

$$\cancel{A_{n,t}} + \cancel{B_{n,t}} = nC_{n,t} - n(n-1)$$

消去 $\cancel{A_{n+1,t+1}}$
和 $\cancel{B_{n+1,t+1}}$

$$\cancel{A_{n+1,t+1}} + \cancel{B_{n+1,t+1}} = (n+1)C_{n+1,t+1} - n(n+1)$$

$$A_{n,t+1} + \cancel{B_{n,t+1}} = nC_{n,t+1} - n(n-1)$$

$$\cancel{B_{n+1,t+1}} - \cancel{B_{n,t+1}} = C_{n,t+1}$$

消去最后两
项

$$A_{n-1,t} + B_{n-1,t} = (n-1)C_{n-1,t} - (n-2)(n-1)$$

解递推方程

- 所以只需

$$\alpha C_{n+1,t+1} + \beta C_{n,t+1} + \gamma C_{n,t} + \theta C_{n-1,t}$$

就可以得到和**AB**无关的式子

$$C_{n+1,t+1} - C_{n,t+1} - C_{n,t} + C_{n-1,t} = \frac{2}{n+1}$$

边界条件

- 类似对快排时间复杂度的分析

$$C_{n,1} = n - 1 + \frac{1}{n}(C_{1,1} + \cdots + C_{n-1,1})$$

$$n(C_{n,1} - (n - 1)) = \sum_{i=1}^{n-1} C_{i,1}$$

$$(n + 1)(C_{n+1,1} - n) = \sum_{i=1}^n C_{i,1}$$

$$C_{n+1,1} - C_{n,1} = 2 - \frac{2}{n + 1}$$

边界条件

- 类似对快排时间复杂度的分析

$$C_{n,1} = 2 - \frac{2}{n} + C_{n-1,1}$$

$$= \dots$$

$$= 2n - 2 \sum_{i=1}^n \frac{1}{i}$$

$$= 2n - 2H_n$$

解递推方程

- 这样就可以求解刚才的方程了

$$\begin{aligned}C_{n,t} - C_{n-1,t-1} &= \frac{2}{n} + C_{n-1,t} - C_{n-2,t-1} \\&= 2 \sum_{i=t+1}^n \frac{1}{i} + C_{t,t} - C_{t-1,t-1} \\&= 2(H_n - H_t) + 2 - \frac{2}{t}\end{aligned}$$

解递推方程

- 这同样是一个递推式

$$\begin{aligned}C_{n,t} &= 2(H_n - H_t) + 2 - \frac{2}{t} + C_{n-1,t-1} \\&= 2(H_n - H_t) + 2 - \frac{2}{t} + 2(H_{n-1} - H_{t-1}) + 2 - \frac{2}{t-1} + C_{n-2,t-2} \\&= \dots \\&= 2 \sum_{2 \leq k \leq t} (H_{n-t+k} - H_k + 1 - \frac{1}{k}) + C_{n+1-t,1}\end{aligned}$$

解递推方程

- 归纳

$$\begin{aligned}C_{n,t} &= 2 \sum_{2 \leq k \leq t} \left(H_{n-t+k} - H_k + 1 - \frac{1}{k} \right) + C_{n+1-t,1} \\&= 2((n+1)H_n - (n+3-t)H_{n+1-t} - (t+2)H_t + n+3) \quad \text{why?}\end{aligned}$$

$$\delta(\text{left}) = 2\left(H_{m+1} - H_{m-t+2} + 1 - \frac{1}{m+2-t}\right)$$

$$\delta(\text{right}) = 2\left(H_{m+1} - H_{m+2-t} - \frac{m+3-t}{m+2-t} + 1\right)$$

求中位数

- 将 $n = 2t - 1$ 代入

$$\begin{aligned} C_{2t+1,t} &= 4t(H_{2t-1} - H_t) + 4t - 8H_t + 4 \\ &= (4 + 4 \ln 2)t - 8 + 1 - 8\gamma + O(t^{-1}) \end{aligned}$$

$$H_n = \sum_{k=1}^n \frac{1}{k} = \ln n + \gamma + \frac{1}{2n} - \frac{1}{12n^2} + \frac{1}{120n^4} + \dots$$

Type B?

- 比较次数的界在哪里?
 - $t = 1 \implies n - 1$
 - $t = 2 \implies n - 2 + \lceil \log_2 n \rceil$
 - $t = 3 \implies ???$

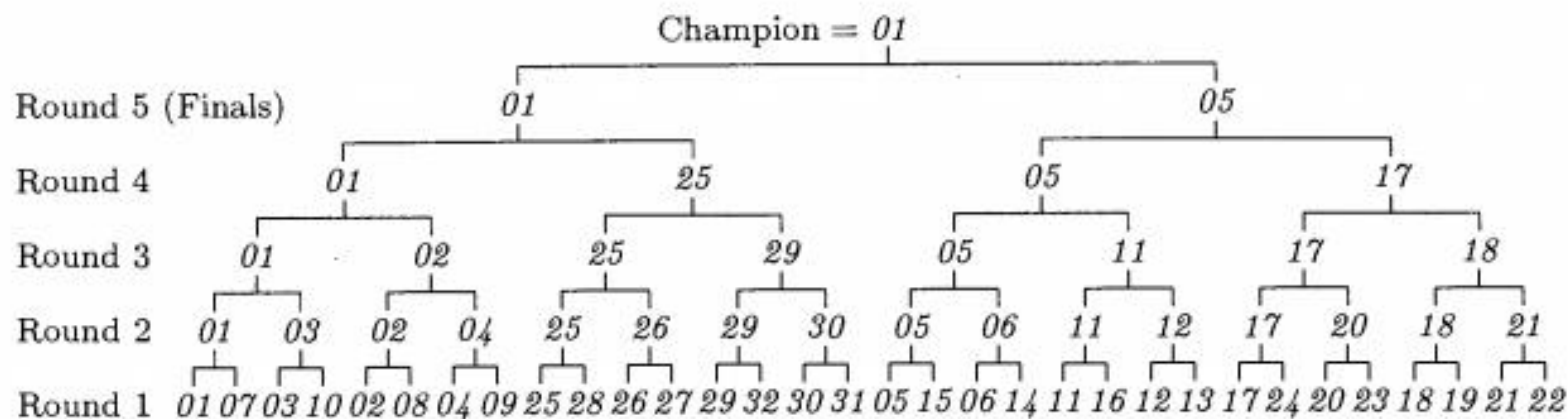

Fig. 39. A knockout tournament with 32 players.

Type B?

- 对任意的 n, t , 比较次数不超过 $5.2n$
- 平均次数不超过 $n + \min(t, n + 1 - t) + o(n)$
- 中位数可以做到 $1.5n + O(n^{2/3} \log n)$
平均 $1.25n + o(n)$

Table 1
